FIFTEENTH ANNUAL CONFERENCE

YUCOMAT 2013

Hunguest Hotel Sun Resort Herceg Novi, Montenegro, September 2-6, 2013 http://www.mrs-serbia.org.rs

Programme and The Book of Abstracts

Organised by:

Materials Research Society of Serbia

under the auspices of
Federation of European Material Societies
and
Materials Research Society

Title: THE FIFTEENTH ANNUAL CONFERENCE

YUCOMAT 2013

Programme and The Book of Abstracts

Publisher: Materials Research Society of Serbia

Knez Mihailova 35/IV, 11000 Belgrade, Serbia Phone: +381 11 2185-437; Fax: +381 11 2185-263

SCANNING ELECTRON MICROSCOPY STUDY OF CHANGES IN NANOPARTICLES SURFACE UNDER IN VITRO SIMULATED PHYSIOLOGICAL CONDITIONS

S. Stojanović¹, Ž. Mitić², S. Najman¹, N. Ignjatović³, D. Uskoković³ ¹University of Niš, Faculty of Medicine, Institute of Biology and Human Genetics, Niš, Serbia; ²University of Niš, Faculty of Medicine, Department of Pharmacy, Niš, Serbia; ³Institute for Technical Sciences of the SASA, Belgrade, Serbia

In this study we observed the changes in surface of nanoparticles of two different nanomaterials, cobalt-substituted hydroxyapatite (CoHAp) and calcium phosphate/poly-(DLlactide-co-glycolide) (CP/PLGA) that occurred under simulated physiological conditions in vitro. Both nanomaterials were incubated in an appropriate volume of Dulbecco's Modified Eagle Medium (DMEM) for 3 days at 37 °C and then the medium was removed and materials were dried. Surface changes of nanoparticles were studied by scanning electron microscopy (SEM). Results of SEM analysis show that changes in the size and shape of the nanoparticles took place. These changes can be explained by interactions of nanomaterials with DMEM. In the case of CP/PLGA it was probably the result of polymer degradation and changes in CoHAp nanoparticles were probably the result of ion exchange.

GRAFT-COPOLYMERS OF CHITOSAN AND LACTIDE: SOLID-STATE SYNTHESIS AND APPLICATION FOR TISSUE ENGINEERING

T. Demina, T. Akopova, A. Zelenetskii Enikolopov Institute of Synthetic Polymer Materials, Russian Academy of Sciences, Moscow, Russia

Modification of chitosan, a natural linear polysaccharide, possessed a high potential for biomedical applications is widely proposed to increase its solubility in different mediums as well as to extend its applicability in tissue regeneration and drug delivery systems. In this research, grafting of L,D-lactide side chains onto chitosan have been carried out in a twin-screw extruder under conditions of shear deformation and pressure. Fractional and elemental analysis in combination with IR analysis and GPC showed that processing at different chitosan/L,D-lactide molar ratio and temperature of extrusion leads to formation of graft copolymers with degree of substitution of chitosan amino groups up to 0.41 and degree of lactide polymerization up to 10. The prepared derivatives were used for fabrication of macroporous hydrogels and spherical microcarriers for tissue regeneration.
